

Lab 5: feedback

Dependencies

- no dependencies between jars (`Class-Path` attributes in the jars manifests)

Execution

- the `Server` program (file receiver?) doesn't allow to specify the directory where the files should be copied
- the `Client` program (file sender?) should not be started with a file name. Should be used by the `Gossiper` program when needed
- the `Gossiper` program asks for a file to be sent. Should ask for the properties of another gossip peer
- `PopServer` : when getting messages from the *thunderbird* client, do not display anything and do not reply to the client
