Group AX1 // Invoice management application

Individual assignment

Name: Leonard NAMOLARU

Student number: 51704115

Introduce the project, write what was your part of the project, describe your different tasks and your achievements, in about 250 words.

Our project is a website that allows a business owner to manage his invoices. The site allows the creation of invoices, the creation of a customer list, a list of products and services, a list of contracts that have been signed with the customers, as well as the management of a list of users who have access to this database. If it is a small business, there is probably one person who manages everything, but if it is a slightly larger company, then the system allows several users to access the database: the CEO, the account manager, the secretary and so on.

The part I was responsible for in the project is managing the list of users. This section includes the page with the user details in the site administration panel, but also the login page and the registration page.

The only page that can be accessed when we are disconnected from the system is the registration page. If our company has another employee that we are interested in giving him access to the database, we will ask him to register.

After completing the registration, we are immediately taken to the login page, but we may notice that it is not possible to connect with the user we just created. This is because of the

desire to maintain the privacy and security of the data on the site and therefore only a user approved by an existing user will be able to connect. So, with the user we just created we will not be able to connect, but if we try to connect with another user, who already exists in the system, we can go to the page with the users list and see that the new user has been added to the list. Then we can activate him.
